

PPS Secondary Mathematics Curriculum: Geometry

**Plainfield Public Schools
Mathematics
Unit Planning Organizer**

Grade/Course	Geometry
Unit of Study	Unit 2 Similarity and Proof
Pacing	7 weeks including 2 weeks for reteaching or enrichment
Dates	November 14 –January 20.2017

Standards for Mathematical Practice	
MP1.	Make sense of problems and persevere in solving them.
MP2.	Reason abstractly and quantitatively.
MP3.	Construct viable arguments and critique the reasoning of others.
MP4.	Model with mathematics.
MP5.	Use appropriate tools strategically.
MP6.	Attend to precision.
MP7.	Look for and make use of structure.
MP8.	Look for and express regularity in repeated reasoning.

Unit Standards

G.SRT.1 Verify experimentally the properties of dilations given by a center and a scale factor.

- A dilation takes a line not passing through the center of the dilation to a parallel line, and leaves a line passing through the center unchanged.
- The dilation of a line segment is longer or shorter in the ratio given by the scale factor.

G.SRT.2 Given two figures, use the definition of similarity in terms of similarity transformations to decide if they are similar; explain using similarity transformations the meaning of similarity for triangles as the equality of all corresponding pairs of angles and the proportionality of all corresponding pairs of sides.

G.SRT.3 Use the properties of similarity transformations to establish the AA criterion for two triangles to be similar.

G.SRT.4 Prove theorems about triangles. Theorems include: a line parallel to one side of a triangle divides the other two proportionally, and conversely; the Pythagorean Theorem proved using triangle similarity.

G.CO.C.9 Prove theorems about lines and angles. Theorems include: vertical angles are congruent; when a transversal crosses parallel lines, alternate interior angles are congruent and corresponding angles are congruent; points on a perpendicular bisector of a line segment are exactly those equidistant from the segment's endpoints.

G.CO.10 Prove theorems about triangles. Theorems include: measures of interior angles of a triangle sum to 180° ; base angles of isosceles triangles are congruent; the segment joining midpoints of two sides of a triangle is parallel to the third side and half the length; the medians of a triangle meet at a point.

G.CO.C.11 Prove theorems about parallelograms. Theorems include: opposite sides are congruent, opposite angles are congruent, the diagonals of a parallelogram bisect each other, and conversely, rectangles are parallelograms with congruent diagonals.

<p>HS.G-CO.C.10. Prove theorems about triangles. <i>Theorems include: measures of interior angles of a triangle sum to 180°; base angles of isosceles triangles are congruent; the segment joining midpoints of two sides of a triangle is parallel to the third side and half the length; the medians of a triangle meet at a point.</i></p>	<p><i>HS.MP.3.</i> Construct viable arguments and critique the reasoning of others.</p> <p><i>HS.MP.5.</i> Use appropriate tools strategically.</p>	<p>Students may use geometric simulations (computer software or graphing calculator) to explore theorems about triangles.</p>

PPS Secondary Mathematics Curriculum: Geometry

<p>HS.G-CO.C.11. Prove theorems about parallelograms. Theorems include: opposite sides are congruent, opposite angles are congruent, the diagonals of a parallelogram bisect each other, and conversely, rectangles are parallelograms with congruent diagonals.</p>	<p><i>HS.MP.3. Construct viable arguments and critique the reasoning of others.</i></p> <p><i>HS.MP.5. Use appropriate tools strategically.</i></p>	<p>Students may use geometric simulations (computer software or graphing calculator) to explore theorems about parallelograms.</p>
---	---	--

Essential QuestionsCorresponding Big Ideas

Essential Questions	Corresponding Big Ideas
<p>How do you write a geometric proof?</p> <p>Given two figures are similar, how do you find the length of a missing side ?</p> <p>How do you identify a similarity transformation in a plane?</p> <p>How can similarity and congruence be used to solve problems and/or prove statements about or properties of triangles?</p>	<p>A diagram is a sophisticated mathematical device for thinking and communicating. A diagram is a built geometric artifact, with both a history- a narrative of successive construction- and a purpose. A diagram is not a picture. It needs to be interpreted: learning how to read a diagram can be like learning a new language.</p> <p>Empirical verification is an important part of the process of proving, but it can never, by itself, constitute a proof. Geometry uses a wide variety of kinds of proofs.</p> <p>The processes of proving include a variety of activities, such as developing conjectures, considering the general case, exploring with examples, looking for structural similarities across cases, and searching for counterexamples.</p> <p>Making sense of others' arguments and determining their validity are proof-related activities. A proof can have many different valid representational forms, including narrative, picture, diagram, two-column presentation, or algebraic form.</p> <p>Underlying any geometric theorem is an invariance- something that does not change while something else does.</p> <p>Similar geometric figures have angles that are congruent and segments that are proportional in length.</p>

PPS Secondary Mathematics Curriculum: Geometry

Similar geometric figures can be created by transformations. All transformations create similar geometric figures. Dilations, in particular create figures that are similar, but may not be congruent. Congruence is also similarity. It is just a more specifically defined similarity where the ratio of lengths is 1:1.
